Job Market Paper

“Product Entry in the Global Automobile Industry” (2024)

Changes in product offerings are important for understanding changes in market outcomes in the automobile industry. In a global industry, national subsidies affect global market outcomes through firms’ product portfolio decisions. This paper proposes a new model to study product entry in a multi-market setting with product differentiation and heterogeneous consumer preferences within and across countries. Methodologically, the contribution of this paper is to provide a method to estimate and solve entry games with multiple asymmetric firms, each making multiple discrete choices. Using data on global passenger vehicle sales, prices, and product characteristics, I estimate large overhead product line costs, which imply that firms have strong incentives to offer the same product in different markets to achieve sufficient scale. I quantify the effects of discriminatory production and consumption subsidies favoring US brands in the United States. I find that global product portfolio changes in response to these policies cause profit shifting towards US brands worldwide and that changes in consumer surplus vary greatly across markets due to heterogeneity in preferences.
